

What is claimed is:

1. A system for a material testing machine, comprising:

5 a material testing machine having a load mechanism for applying a load to a test piece, sensors for detecting information regarding a load caused by the load mechanism and information regarding a condition of the test piece in accordance with the load, and a computer electrically connected to the sensors for receiving outputs from the sensors and processing data to thereby obtain test information,

10 an outside provider electrically connected to the computer, and

information means electrically connected to the outside provider for receiving outputs of the computer through the outside provider.

20 2. A system for a material testing machine according to claim 1, wherein said information means is a web site established in the outside provider, and said computer is set to update the test information periodically to the web site, said web site including updated test information accessible at any time from another computer or a portable terminal.

25 3. A system for a material testing machine according to claim 1, wherein said information means is a control computer disposed independently and connected to the outside provider, said computer being set to periodically send the test information by an electronic mail to the control computer.

4. A system for a material testing machine according to claim 3,  
further comprising another material testing machine having a load  
mechanism for applying a load to a test piece, sensors for  
detecting information regarding a load caused by the load mechanism  
and information regarding a condition of the test piece in  
accordance with the load, and another computer electrically  
connected to the sensors of the another material testing machine  
for receiving outputs from the sensors and processing data to  
thereby obtain test information, said another computer being  
electrically connected to the control computer to periodically send  
the test information by an electronic mail to the control computer.

5. A system for a material testing machine according to claim 1,  
wherein said information means is a terminal disposed independently  
and connected to the outside provider, said computer being set to  
periodically send the test information by an electronic mail to the  
terminal.
